RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 34 pages. Original publisher: Bethesda, Md. : National Institutes of Health, Office of the Director ; Kensington, MD : NIH Consensus Development Program Information Center distributor, 2002 OCLC Number: (OCoLC)53947476 Subject: Adrenal glands -- Diseases -- United States. Excerpt: . . . 4 cm are benign. A standardized measure of X-ray absorption known as CT attenuation value, conventionally expressed in Hounsfield units ( HU ), may differentiate between benign and malignant lesions. A homogeneous mass with a smooth border and an attenuation value of less than 10 HU on an unenhanced CT study strongly suggests the diagnosis of a benign adrenal adenoma. The optimal diagnostic evaluation has not been established for adrenal masses between 4 - 6 cm. If these lesions are hormonally inactive and exhibit a benign imaging appearance as described above, they can be monitored. Lesions greater than 6 cm are more likely to be malignant; therefore, surgery should be considered. Magnetic resonance imaging is equally effective as CT in distinguishing benign from malignant lesions. A benign adenoma exhibits a signal drop on chemical shift imaging and has an intensity similar to that of the liver...
